NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >-30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by This sequence was finished as follows unless otherwise noted:

### MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. MC. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc Louis

#### SOURCE INFORMATION:

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J., and de Jong, P. J. (1998) An improved approach for construction of bacterial artificial chromosome and coworkers at http://www.chori.org Research Genetics, ibraries. pBACe3.6 Genomics 51:1-8. Inc. (http://www.resgen.com) or Pieter de Jong The clone may be obtained either from

# NEIGHBORING SEQUENCE INFORMATION:

The clone sequenced to the left is RP11-384K6; the clone sequenced to the right is RP11-358D17, 2000 bp overlap. Actual start of this clone is at base position 1 of RP11-100C9; actual end is at base position 34330 of RP11-358D17. this

The sequence of AC009865 has been incorporated Location/Qualifiers into AC108030

all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by This sequence was finished as follows unless otherwise noted:

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc

SOURCE INFORMATION:

Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome http://bacpac.med.buffalo.edu) The RPCI-11 Genomics 51:1-8. human BAC library was made from the blood of one male The clone may be obtained either from

NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the right is AC006568.
clone is at base position 1 of RP11-415C15. Actual start of this

FEATURES The region between 36765 to 36883 is covered only by a single ocation/Qualifiers

                                                                                                                                                                                                                                                      (WESA )
                                                                                                                                                                                                                                                                                 07-JUN-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             washed and incubated under growth conditions. In an example, the presence of HCV in culture medium of monkey kidney cells inoculated with HCV infected serum was verified by PCR amplification using two external primers (OUI and OUZ, see AAT39731 and AAT39732) and two internal primers (INI and INZ, see AAT39733 and AAT39734). The amplified products were identified by hybridisation to labelled probe S1 (see AAT39735). Small amounts of virus were shown to be released into the culture medium from secondary cultures. Control (non-inoculated) cells were negative for presence of viral genome.
                                                                                                                                                                                                                                                                                                             03-JUN-1997;
                                                                                                                                                                                                                                                                                                                                    11-DEC-1997.

                            The invention relates to a probe containing a 410 or 20 base pair sequence, given in the specification. It is capable of detecting the tuberculosis bacterial group including Mycobacterium tuberculosis, Mycobacterium bovis BCG, Mycobacterium africanum, Mycobacterium microti and/or Mycobacterium canotti. The method is useful in disease diagnosis and monitoring therapy. This polynucleotide sequence represents a PCR primer relating to the detection of pathogenic microorganisms of the

                                                                                                                                                                                                                                                                                                 hepatitis G (HGV), or HIV, fungl, protozoa, parasites or mycoplasma. The method can be used to detect the presence of genetic mutations which have diagnostic or prognostic value. Pathogen contamination of food and drink supplies can also be detected using the method. The method provides for the sensitive and specific detection of ss PN analytes at concentration as low as 0.1fg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI;
                                                                                                                                                                                                                                                                                 Sequence 68
                                                                                                                                                                                                                                                                                                                                                 probes which hybridize to the analyte and are bound to a solid support probes which hybridize to the analyte and are bound to a solid support where double-stranded (ds) polynucleotides are detected. The method can be used for detecting ss PN analytes for the detection of pathogens such as bacteria, viruses such as hepatitis C (HCV), hepatitis B (HBV), as because of mycoplasma. The hepatitis G (HGV), or HIV, fungi, protozoa, parasites or mycoplasma. The
                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a new method for detection (ss) polynucleotide analytes that comprises using ss

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (ss) polynucleotide analytes that comprises using ss polynucleotide probes which hybridize to the analyte and are bound to a solid support where double-stranded (ds) polynucleotides are detected. The method can be used for detecting ss PN analytes for the detection of pathogens such as bacteria, viruses such as hepatitis C (RfV), hepatitis B (HBV), hepatitis G (HGV), or HIV, fungl, protozoa, parasites or mycoplasma. The method can be used to detect the presence of genetic mutations which have diagnostic or prognostic value. Pathogen contamination of food and drink supplies can also be detected using the method. The method provides for the sensitive and specific detection of ss PN analytes at concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 6; Page 66; 73pp;

                      involves use of the ligase dependent polymerase chain reaction method (LD-PCR). In this method, two probes are provided. The first probe contains a region at the 5' end which is complementary and will hybridise with the TNA, the 3' end of the first probe is generic and is bound to one half of a ligand binding pair (LBP). The second probe contains a region at the 5' end which is complementary region of the first probe. It is immediately adjacent to the complementary region of the first probe. It is a conventional ligase. The TNA, they can be ligated together using binding the first probe to a paramagnetic bead to which is attached the probe complex which can then be detected either by a label attached to the second probe, by using an external probe or by PCR using the ligated.
                                                                                                                                                                                                                                                                                                Ligation dep
                                                                                                                                                                                                                               A novel
                                                                                                                                                                                                                                                         Example

                Hepatitis B virus (HBV) and hepatitis C virus (HCV) can be analysed simultaneously using specific sets of PCR primers. Specifically, viral nucleic acids are isolated by treating human serum with a guanidine isothiocyanate containing solution. HBV and HCV nucleic acids are then absorbed on silica and a first polymerase chain reaction is performed using primers HB-1 and HB-2 (AAT65089 and AAT65090) and HC-1 and HC-2 (AAT65093 and AAT65094). A second PCR is then performed with the primers HB-3 and HB-4 (AAT65091 and AAT65092) and HC-3 and HC-4 (AAT65095 and AAT65095). A PCR fragment of 258 bp is produced for HBV and a PCR fragment of 163 bp is produced for HBV and a PCR fragment of 163 bp is produced for HBV and represents a fragment from HCV.
                                                                                                                                                                                                Example 3; Page 7;

                                                                                                                                                                                                                                                                                                                                                                                              2-1. The 5'-UTR includes several stem-loop sequences. The antisense RNA is useful for inhibiting expression of HCV structural genes and thereby inhibiting viral replication in vivo. The antisense therapy can be used in addition to conventional interferon treatment of HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI;

In this method, two probes are provided. The first probe contains a region at the 5' end which is complementary and will hybriwith the TNA, the 3' end of the first probe is generic and is bound tone half of a ligand binding pair (LBP). The second probe contains a region at the 5' end which is complementary to a region in the TNA where the second probe contains a region at the 5' end which is complementary to a region in the TNA where the second probe contains a region at the 5' end which is complementary to a region in the TNA where the second probe contains a region at the 5' end which is complementary to a region in the TNA where the second probe contains a region at the 5' end which is complementary to a region in the TNA where the second probe contains a region at the 5' end which is complementary to a region in the TNA where the second probe contains a region at the 5' end which is complementary to a region in the TNA where the second probe contains a region at the 5' end which is complementary to a region in the TNA where the second probe contains a region at the 5' end which is complementary to a region in the TNA where the second probe contains a region at the 5' end which is complementary to a region in the TNA where the second problementary to a region in the TNA where the second problementary to a region in the TNA where the second problementary to a region in the TNA where the second problementary to a region in the TNA where the second problementary to a region in the TNA where the second problementary the second problementary the second problementary the second problementary the second problementary the second problementary the second problementary the second problementary the second problementary the second problementary the second problementary the second problementary the second problementary the second problementary the second problementary the second
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                region at the 5' end which is complementary to a region in the TNA which is immediately adjacent to the complementary region of the first probe. When the probes are bound to the TNA, they can be ligated together using a conventional ligase. The TNA: ligated probe complex can be isolated by binding the first probe to a paramagnetic bead to which is attached the second half of the LBP. The TNA can be dissociated from the ligated probe complex which can then be detected either by a label attached to the second probe, by using an external probe or by PCR using the ligated probes as a template.

The probes AAT(09170-1 are used to detect the presence of Hepatitis C region of the complex which can be detected either by a label attached to the second probe as a template.
                                                                                                                                                                                                                                                                                                                                                                                                                                  virus in a sample. This sequence results probes and contains sequence which is comphepatitis C virus 5' untranslated region. by PCR using the primers AATO9159-60.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ligation dependent polymerase chain reaction infections pathogens and abnormal human genes
                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 4; Page 51; 100pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           neoplasia

                                                                                                                                                                                                                                   -255 to
                                                                                                                                                                                                                                                                                         AAQ43062
                                                                                                                                                                                                                                                                                                              AAQ43062 standard; cDNA; 159
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the target nucleic acid isolation procedure, which can be performed in microtubes, microchips or micro-well plates, if desired. The method also allows the direct detection of RNA by probe amplification without the need for DNA template production. The assembly of the amplifiable of a single mutation in a target. The method can be easily automated. The present sequence represents the nucleic acid detection method the present start is a single middle applification sequence used in an example of the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 145 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The method allows for rapid, sensitive and standardised detection and quantification of nucleic acids from pathogenic microorganisms from samples from patients with infectious diseases. The method simplifies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                detecting a target nucleic acid in sample. Preferably, the method is useful for detecting and quantitating nucleic acids from pathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acid using a Capture/Amplification (C/A) probe and an amplification probe (A-probe), where C/A probe contains generic sequences and sequences complementary to trarget nucleic acid sequence, and also contains a ligand bound to the non-complementary sequence of probe; ligand is capable of forming an affinity pair with a ligand binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting a target nucleic acid by a ramification extension amplification method, involves carrying out the steps of carcarrying out ligand-dependent amplification and detection of target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example |
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (BRAN/)

XX DNA encoding antigenic peptide(s) of new types of hepatitis C virus for diagnosing and treating HCV infection, screening virus for diagnosing and treating HCV types

PT virus for diagnosing and treating HCV types

PT blood samples and identifying different HCV types

PT blood samples and identifying different HCV types

PS Disclosure; Fig 1; 120pp; English.

CC The sequences given in AAQ43058-75 show the -255 to -62 non-coding cregion of hepatitis C virus (HCV) samples from 18 blood donors and cother HCV varients. Analysis of this region revealed the existance of three distinct groups of they differing by 9-14% in nucleotide cc sequence. Two of the groups identified were similar to those of HCV a novel virus type 1 and 2, whilst the third appeared to represent the NS-5 region (see also AAR37923-26), showed a high degree of sequence CC diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-3 (see AAR37927-30) xx

                                                                                       The sequences given in AAQ43058-75 show the -255 to -62 non-coding region of hepatitis C virus (HCV) samples from 18 blood donors and other HCV varients. Analysis of this region revealed the existance of three distinct groups of HCV differing by 9-14% in nucleotide sequence. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel virus type. Comparison of other regions of the genome, eg. the NS-5 region (see also AAR37923-26), showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-3 (see AAR37927-30) and core region (see AAR37931) between type 3 and type 1 sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                  Chan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of three distinct groups of HCV differing by 9-14% in nucleotide sequence.                                                                                                                                                                                                The sequences given in AAQ43058-75 show the -255 to -62 non-coding region of hepatitis C virus (HCV) samples from 18 blood donors and other HCV varients. Analysis of this region revealed the existance of three distinct groups of HCV differing by 9-14% in nucleotide sequence. Two of the groups identified were similar to those of HCV varients termed type 1 and 2, whilst the third appeared to represent a novel virus type. Comparison of other regions of the genome, eg. the NS-5 region (see also AAR37923-26), showed a high degree of sequence diversity with type 3 being phylogenetically different to type 1 and 2. The same degree differentiation was noted in the NS-3 (see AAR37927-30) and core region (see AAR37931) between type 3 and type 1 sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA encoding antigenic peptide(s) of new types of hepatitis virus - for diagnosing and treating HCV infection, screening blood samples and identifying different HCV types

The method is also useful for diagnosis of pathological molecule(s). The method is presence of specific nucleic acid molecule(s). The methods are particularly suited for identifying of polymorphisms, tissue typing or in clinical applications. The sequence of polymorphisms, tissue typing or in clinical applications. The sequence genotype, amplified in the invention to type HCV-positive sera.

                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                secondary structure. The method comprises amplifying a target nucleic that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                  Sequence 328 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              constructs expressing one NS protein were found to elicit strong antigen specific immune responses in both arms of the immune system. This demonstrated that the NS proteins are better antigens for stimulating humoral immune responses as compared with previous studies using the HCV core structural protein. The genetic vaccine is useful for inducing an immune response (cellular or humoral) against hepatitis C virus in a human uninfected by the virus, and for immunising a human susceptible to hepatitis C viral infection by inducing an immune response. The composition is also useful for treating a human infected with hepatitis C virus, by induction of an immune response. The advantage of this method of immunisation compared with immunisations with soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (NS) proteins. The HCV genome encodes three NS proteins: NS3, a serine protease/viral helicase; NS4; and NS5, the viral RNA-dependent RNA polymerase. In HCV infection, these and other virally encoded proteins are produced by proteolytic processing of a precursor polypeptide. However, for use in a genetic vaccine, the sequences coding for NS proteins had to be engineered so that each NS sequence had its own initiation and stop codons. Restriction sites were also engineered into the gene fragments to aid subcloning. The gene fragments were isolated and mutated using PCR. The NS3 coding sequence was modified using PCR primers AAZ08981 and AAZ08985, and the NS5 coding sequence modified using AAZ08984 and AAZ08985. Studies in munised with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the hepatitis C virus (HCV) 5' untranslated region (5' UTR). This is preferred for use as a promoter in a

The oligonucleotides have virucide, hepatotropic and anti-inflammatory activity, and are useful for treating HCV infection by inhibiting translation of type I-V HCV RNA. Hepatitis C virus is a positive strand RNA virus, and is the major causative agent of post-transfusion hepatitis. Persistent HCV infection can lead to chronic hepatitis, cirrhosis, and hepatocellular carcinoma.
                                                                                                                                                                                                                                                                   Sequence 342 BP; 69 A; 106 C; 103 G; 64 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                 RNA sequences were converted into CDNA using transcriptase in the presence of one of the primer sequences given in AAQ32340-46. The CDNA sequences isolated represent different alleles of the same region of the HCV|gene. The entire HCV gene (see AAQ32436) is useful in the development of a diagnostic method which is more accurate and effective than conventional ones, in the detection of antibodies raised against a wide range of HCVs which have been hardly detected before. The complete gene may be used in an in vitro screening system for a substance capable of specifically supressing or controlling a proteolytic processing of a precursor polypeptide of HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAQ32438-39 and AAQ32444-53 are various clones which encode the polypeptide core-envelope region of the Hepatitis C Virus (HCV) gene of the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into CDNA using transcriptage in the

AAQ32445
         Sequence 483
                                before. The complete gene may be used in an in vitro screening system for a substance capable of specifically supressing or controlling a proteolytic processing of a precursor polypeptide of HCV.
                                                                                   RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ32540-46. The sequences isolated represent different alleles of the same region of the HCV gene. The entire HCV gene (see AAQ32436) is useful in the development of a diagnostic method which is more accurate and raised against a wide range of HCVs which have been hardly detected raised against a wide range of HCVs which have been hardly detected
                                                                           before.

                                                                                                                                                                The present invention describes a vector comprising a cDNA encoding an RNA virus gene, constructed to ensure the exact and homogeneous transcription of both terminals of the RNA virus gene. Also described is a method for screening drugs for inhibiting the replication of RNA virus by using the RNA viral infection model animal, particularly one with hepatitis C viral infection. The vector is useful in clarifying the mechanism of RNA viral replication, onset of RNA viral infection, and developing remedies and therapeutics for RNA viral infections, particularly of a hepatitis C virus. The present sequence represents

                 Oligonucleotides which are complementary to part of the hepatitis virus genomic or messenger RNA are claimed. Preferred antisense oligonucleotides are complementary to RNA comprising regions of the 5'-UTR, esp. the 5'end hairpin loop, 5'end 6bp repeat and 5'end untranslated region.

                                                                                                 The present invention describes a vector comprising a cDNA encoding an RNA virus gene, constructed to ensure the exact and homogeneous transcription of both terminals of the RNA virus gene. Also described is a method for screening drugs for inhibiting the replication of RNA virus by using the RNA viral infection model animal, particularly one with hepatitis C viral infection. The vector is useful in clarifying the mechanism of RNA viral replication, onset of RNA viral infection,

Claim 18; Page 82-84;

94pp;

Japanese.

The present invention describes an oligonucleotide sequence which potentiates the expression of a useful gene when incorporated in a gene expression vector, where the oligonucleotide sequence consists of the 5'-non-translated region (5'UTR) of a viral genome or its fragment or modified form. The 5'UTR sequence is useful in screening potential initiation factors of interaction with the viral IRES or

screening

Nucleic acid sequence which potentiates gene expression and contains 5'-non-translated region of a viral genome is incorporated in vector for improving the expression of a useful gene

vectors

The present sequence represents a Hepatitis type C virus (HCV) nucleotide sequence comprising a 5'UTR, which is used in the exemplification of the present invention.
                   The present invention relates to a method for titration of hepatitis C virus in serum. The method comprises quantitive and competitive polymerase.chain reaction (PCR). The present sequence, a 5 untranslaregion (UTR) of Hepatitis C virus, was used to illustrate the invent:

Pred. No.

is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
